## **DETAILED ACTION**

### ***Drawings***

1. This application has been filed with informal drawings, which are acceptable for examination purposes only. Formal drawings will be required when the application is allowed.

### ***Specification***

2. The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.
3. The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.

The following title is suggested: Automatic Starting And Fault Protected Multi-Phase Engine Generator Apparatus.

### ***Claim Rejections - 35 USC § 102***

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

5. Claims 1-4 are rejected under 35 U.S.C. 102(b) as being anticipated by U.S. Patent No. 5,512,811 to Latos et al.

Latos et al. clearly teaches the construction of an engine generator apparatus (10) for rectifying and converting an alternating output of a generator, which has multi-phase windings (column 4, lines 13-16) and is driven by an engine, and converting the rectified output by an

Art Unit: 2834

inverter (142) into an alternating current at the frequency of a power system and the alternating current is interconnected with the source of said power system, comprising:

a means for starting the interconnection with the system source (94) when a direct current voltage (12) rectified rises up to first predetermined level after the start up of the engine and then increasing the output of the inverter;

a means for canceling the interconnection (36) when the direct current voltage drops down to below second predetermined level, and for re-starting the interconnection with the system source when the direct current voltage returns back to the first predetermined level;

a fault detecting means (50) for judging that the power generator has a fault when the direct current voltage drops down to below the second predetermined level after the re-starting of the interconnection;

a means where a generator fault signal is outputted, when the canceling and the re-starting of the interconnection with the power system is repeated; and

a means (130) where a generator fault signal is outputted, when the canceling and the re-starting of the interconnection with the power system is repeated wherein the output of the inverter is gradually increased (column 3, lines 7-12) at the start of the interconnection of the apparatus with the power system.

### ***Conclusion***

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. See PTO-892.
